

periodic lattice $L = 36$, capacity 16 per cell

r_{80} = smallest achievable lattice distance at which the empirical cumulative field first reaches 0.8

b

one step; then $t \rightarrow t + 1$

births enter after transport, so a newborn takes no step in its own birth step; burn-in 2000, horizon 11000, one frame every 50 steps; the within-arm summary is the median over frames
